

Homework 1 – Evaluating Expressions

- Evaluate these Boolean expressions given the following is true:
`>>> a = 7; b = 11; c = 4; d = '4'`

Boolean expression	True / False with result
<code>a < 0b100</code>	
<code>a + c <= b</code>	
<code>c != d</code>	
<code>b - a > c</code>	
<code>b - a >= c</code>	
<code>c != int(d)</code>	
<code>b - a == int(d)</code>	

Homework 2 – Amount Due

- Write a simple Python program where the user inputs the price of an item in Rs., its name, and the amount of that item purchased. Then output a summary of the purchase, also known as a receipt.
- Complete this task in using four (4) different methods:
 - the modulus operator %
 - `str.format()`
 - `f.string format`
 - template strings
- Example final execution:

```
Item price in Rs.: 7
Quantity purchased: 22
Name of item purchased:
7 items @ 22 Rs. each | Total Cost: 99 Rs.
```

Homework 3 – Developing Your Style

- Look at the different solutions you used to solve the previous homework problem, Amount Due. Of the four methods used:
- Which do you like the most? Why is it your most favorite?
- Which do you like the least? Why is it your least favorite?
- Be ready to share with the class!
- Hint: There is no wrong answer!

Thank you!
